List of Figures

Figure 1: long term monitoring of OLCI-A CCD temperatures using minimum value (top), time averaged values (middle), and maximum value (bottom) provided in the annotations of the Radiometric Calibration Level 1 products, for the Shutter frames, all radiometric calibrations so far except the first one (absolute orbit 183) for which the instrument was not yet thermally stable
Figure 2: Same as Figure 1 for diffuser frames 3
Figure 3: long term monitoring of OLCI-B CCD temperatures using minimum value (top), time averaged values (middle), and maximum value (bottom) provided in the annotations of the Radiometric Calibration Level 1 products, for the Shutter frames, all radiometric calibrations so far except the first one (absolute orbit 167) for which the instrument was not yet thermally stable
Figure 4: same as Figure 3 for diffuser frames5
Figure 5: Sun azimuth angles during acquired OLCI-A Radiometric Calibrations (diffuser frame) on top of nominal yearly cycle (black curve). Diffuser 1 with diamonds, diffuser 2 with crosses, 2016 acquisitions in dark blue, 2017 in clear blue, 2018 in green, 2019 in yellow and 2020 in red7
Figure 6: same as Figure 5 for OLCI-B (2018 in blue, 2019 in green and 2020 in red)7
Figure 7: OLCI-A Sun geometry during radiometric Calibrations on top of characterization ones (diffuser frame)8
Figure 8: same as Figure 7 for OLCI-B8
Figure 9: Dark Offset table for band Oa06 with (red) and without (black) HEP filtering (Radiometric Calibration of 22 July 2017). The strong HEP event near pixel 400 has been detected and removed by the HEP filtering9
Figure 10: OLCI-A Dark Offset for band Oa1 (top) and Oa21 (bottom), all radiometric calibrations so far except the first one (orbit 183) for which the instrument was not thermally stable yet
Figure 11: map of OLCI-A periodic noise for the 5 cameras, for band Oa21. X-axis is detector number (East part, from 540 to 740, where the periodic noise occurs), Y-axis is the orbit number. Y-axis range is focused on the most recent 5000 orbits. The counts have been corrected from the West detectors mean value (not affected by periodic noise) in order to remove mean level gaps and consequently to have a better visualisation of the long term evolution of the periodic noise structure. At the beginning of the mission the periodic noise for band Oa21 had strong amplitude in camera 2, 3 and 5 compared to camera 1 and 4. However PN evolved through the mission and these discrepancies between cameras have been reduced. At the time of this Cyclic Report Camera 2 still shows a slightly higher PN than other cameras.
Figure 12: same as Figure 11 for smear band 12
Figure 13: OLCI-A Dark Current for band Oa1 (top) and Oa21 (bottom), all radiometric calibrations so far except the first one (orbit 183) for which the instrument was not thermally stable yet
Figure 14: left column: ACT mean on 400 first detectors of OLCI-A Dark Current coefficients for spectral band Oa01 (top) and Oa21 (bottom). Right column: same as left column but for Standard deviation instead of mean. We see an increase of the DC level as a function of time especially for band Oa21 13
Figure 15: OLCI-A Dark current increase rates with time (in counts per year) vs. band (left) and vs. band width (right)

except the first one (orbit 167) for which the instrument was not thermally stable yet 15
Figure 17: OLCI-B map of periodic noise for the 5 cameras, for band Oa21. X-axis is detector number (East part, from 540 to 740, where the periodic noise occurs), Y-axis is the orbit number. The counts have been corrected from the West detectors mean value (not affected by periodic noise) in order to remove mean level gaps and consequently to have a better visualisation of the long term evolution of the periodic noise structure
Figure 18: same as Figure 17 for smear band 16
Figure 19: OLCI-B Dark Current for band Oa1 (top) and Oa21 (bottom), all radiometric calibrations so far except the first one (orbit 167) for which the instrument was not thermally stable yet
Figure 20: left column: ACT mean on 400 first detectors of OLCI-B Dark Current coefficients for spectral band Oa01 (top) and Oa21 (bottom). Right column: same as left column but for Standard deviation instead of mean. We see an increase of the DC level as a function of time especially for band Oa21
Figure 21: OLCI-B Dark Current increase rates with time (in counts per year) vs. band (left) and vs. band width (right)
Figure 22: OLCI-A Gain Coefficients for band Oa1 (top) and Oa21 (bottom), all diffuser 1 radiometric calibrations so far except the first one (orbit 183) for which the instrument was not thermally stable yet.
Figure 23: camera averaged gain relative evolution with respect to calibration of 25/04/2016 (change of OLCI channel settings), as a function of elapsed time since the beginning of the mission; one curve for each band (see colour code on plots), one plot for each module. The diffuser ageing has been taken into account
Figure 24: OLCI-B Gain Coefficients for band Oa1 (top) and Oa21 (bottom), all diffuser 1 radiometric calibrations so far except the first one (orbit 167) for which the instrument was not thermally stable yet.
Figure 25: OLCI-B camera averaged gain relative evolution with respect to first calibration after channel programming change (18/06/2018), as a function of elapsed time since the beginning of the mission; one curve for each band (see colour code on plots), one plot for each module. The diffuser ageing has been taken into account
Figure 26: RMS performance of the OLCI-A Gain Model of the current processing baseline as a function of orbit 23
Figure 27: RMS performance of the OLCI-A Gain Model of the previous Processing Baseline as a function of orbit. The blue vertical dotted line defines the limit from which the gain model starts to be extrapolated (i.e. it corresponds to the most recent CAL of the dataset used to build the model)
Figure 28: OLCI-A Camera-averaged instrument evolution since channel programming change (25/04/2016) and up to the most recent calibration (25/12/2020) versus wavelength 25
Figure 29: For the 5 cameras: OLCI-A Evolution model performance, as camera-average and standard deviation of ratio of Model over Data vs. wavelength, for each orbit of the test dataset, including 9 calibrations in extrapolation, with a colour code for each calibration from blue (oldest) to red (most recent)
Figure 30: OLCI-A evolution model performance, as ratio of Model over Data vs. pixels, all cameras side by side, over the whole current calibration dataset (since instrument programing update), including 9 calibrations in extrapolation, channels Oa1 to Oa6

2 Instrument monitoring

2.1 CCD temperatures

2.1.1 OLCI-A

The monitoring of the CCD temperatures is based on MPMF data extractions not yet operational. In the meantime, we monitor the CCD temperatures on the long-term using Radiometric Calibration Annotations (see Figure 1). Variations are very small (0.09 C peak-to-peak) and no trend can be identified. Data from current cycle (rightmost data points) do not show any specificity.

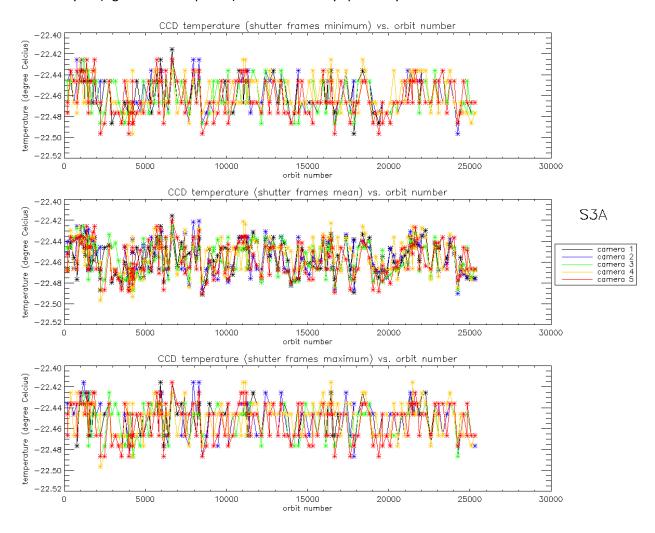

Figure 1: long term monitoring of OLCI-A CCD temperatures using minimum value (top), time averaged values (middle), and maximum value (bottom) provided in the annotations of the Radiometric Calibration Level 1 products, for the Shutter frames, all radiometric calibrations so far except the first one (absolute orbit 183) for which the instrument was not yet thermally stable.

2.2 Radiometric Calibration

For OLCI-A, two Radiometric Calibration Sequences have been acquired during Cycle 066:

- S01 sequence (diffuser 1) on 10/12/2020 13:34 to 13:35 (absolute orbit 25077)
- So1 sequence (diffuser 1) on 25/12/2020 15:48 to 15:50 (absolute orbit 25294)

For OLCI-B, one Radiometric Calibration Sequence has been acquired during Cycle 047:

S01 sequence (diffuser 1) on 26/12/2020 09:39 to 09:41 (absolute orbit 13911)

The acquired Sun azimuth angles are presented on Figure 5 for OLCI-A and Figure 6 for OLCI-B, on top of the nominal values without Yaw Manoeuvre (i.e. with nominal Yaw Steering control of the satellite).

2.2.1 Dark Offsets [OLCI-L1B-CV-230]

Note about the High Energy Particles:

The filtering of High Energy Particle (HEP) events from radiometric calibration data has been implemented (for shutter frames only) in a post processor, allowing generating Dark Offset and Dark Current tables computed on filtered data. The post-processor starts from IPF intermediate data (corrected counts), applies the HEP detection and filtering and finally computes the Dark Offset and Dark Current tables the same way as IPF. An example of the impact of HEP filtering is given in Figure 9.

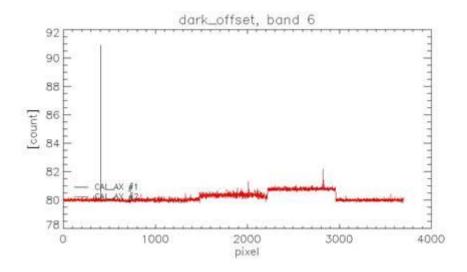

Figure 9: Dark Offset table for band Oa06 with (red) and without (black) HEP filtering (Radiometric Calibration of 22 July 2017). The strong HEP event near pixel 400 has been detected and removed by the HEP filtering.

All results presented below in this section have been obtained using the HEP filtered Dark Offset and Dark Current tables.

Page: 10

2.2.1.2 OLCI-A

Dark offsets

Dark offsets are continuously affected by the global offset induced by the Periodic Noise on the OCL convergence. Current Cycle calibrations are affected the same way as others. The amplitude of the shift varies with band and camera from virtually nothing (e.g. camera 2, band 0a1) to up to 5 counts (Oa21, camera 3). The Periodic Noise itself comes on top of the global shift with its known signature: high frequency oscillations with a rapid damp. This effect remains more or less stable with time in terms of amplitude, frequency and decay length, but its phase varies with time, introducing the global offset mentioned above.

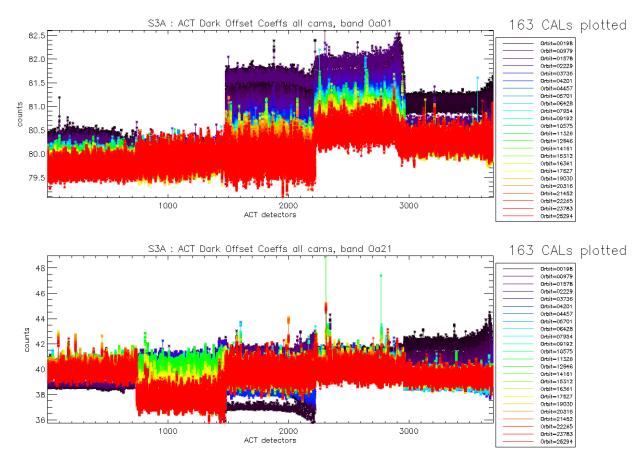

Figure 10: OLCI-A Dark Offset for band Oa1 (top) and Oa21 (bottom), all radiometric calibrations so far except the first one (orbit 183) for which the instrument was not thermally stable yet.

Issue: 1.0

Date: 15/01/2021

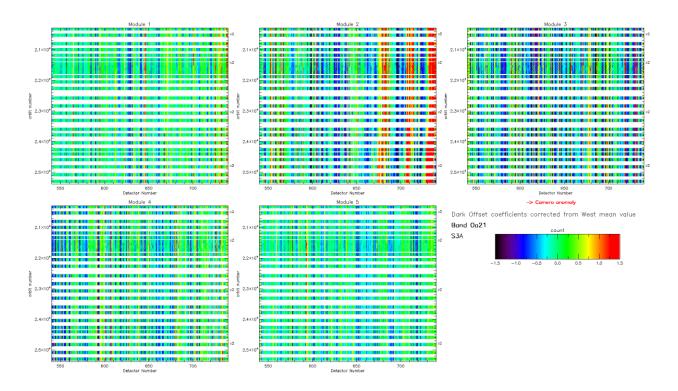

Figure 11: map of OLCI-A periodic noise for the 5 cameras, for band Oa21. X-axis is detector number (East part, from 540 to 740, where the periodic noise occurs), Y-axis is the orbit number. Y-axis range is focused on the most recent 5000 orbits. The counts have been corrected from the West detectors mean value (not affected by periodic noise) in order to remove mean level gaps and consequently to have a better visualisation of the long term evolution of the periodic noise structure. At the beginning of the mission the periodic noise for band Oa21 had strong amplitude in camera 2, 3 and 5 compared to camera 1 and 4. However PN evolved through the

S3 OLCI Cyclic Performance Report

S3A Cycle No. 066 – S3B Cycle No. 047

Ref.: S3MPC.ACR.PR.01-066-047

Issue: 1.0

Date: 15/01/2021

Page: 12

mission and these discrepancies between cameras have been reduced. At the time of this Cyclic Report Camera 2 still shows a slightly higher PN than other cameras.

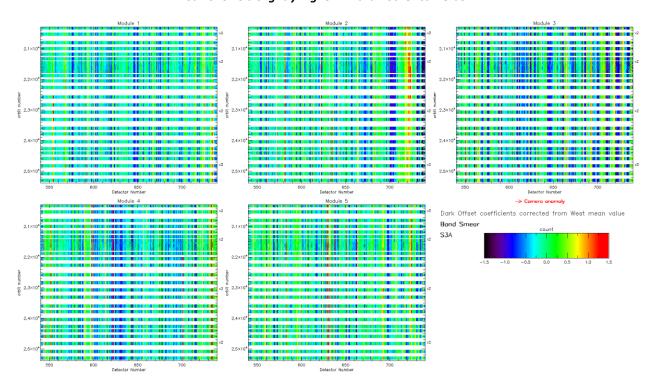

Figure 12: same as Figure 11 for smear band.

Figure 11 and Figure 12 show the so-called 'map of periodic noise' in the 5 cameras, for respectively band 21 and smear band. These maps have been computed from the dark offsets after removal of the mean level of the WEST detectors (not impacted by PN) in order to remove mean level gaps from one CAL to the other and consequently to highlight the shape of the PN. Maps are focused on the last 200 EAST detectors where PN occurs and on a time range covering only the last 5000 orbits in order to better visualize the CALs of the current cycle.

As there was no camera anomaly during the current cycle, there is no sudden change of periodic noise to report during the current cycle. We can see however a small drift in camera 2 Oa21 (Figure 11 upper middle plot) since about orbit 24000 for the last 100 pixels. This kind of drift had already been encountered for the same camera/band/pixels, for example between orbit 13500 and 14500 and between orbit 18000 and 19500 (see previous CR reports).

Dark Currents

Dark Currents (Figure 13) are not affected by the global offset of the Dark Offsets, thanks to the clamping to the average blind pixels value. However, the oscillations of Periodic Noise remain visible. There is no significant evolution of this parameter during the current cycle except the small regular increase (almost linear), for all detectors, since the beginning of the mission (see Figure 14).

Ref.: S3MPC.ACR.PR.01-066-047

Issue: 1.0

Date: 15/01/2021

Page: 14

A possible explanation of the regular increase of DC could be the increase of the number of hot pixels which is more important in Oa21 because this band is made of more CCD lines than band Oa01 and thus receives more cosmic rays impacts. It is known that cosmic rays degrade the structure of the CCD, generating more and more hot pixels at long term scales. Indeed, when computing the time slopes of the spatially averaged Dark Current as a function of band, i.e. the slopes of curves in left plots of Figure 14, one can see that Oa21 is by far the most affected, followed by the smear band (Figure 15, left); when plotting these slopes against total band width (in CCD rows, regardless of the number of micro-bands), the correlation between the slope values and the width becomes clear (Figure 15, right).

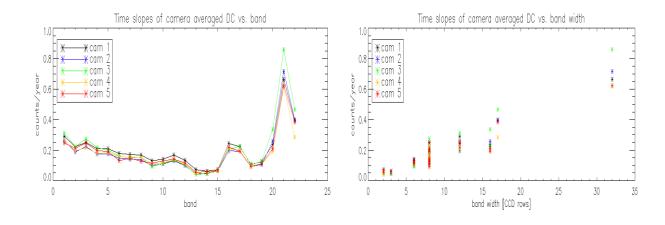

Figure 15: OLCI-A Dark current increase rates with time (in counts per year) vs. band (left) and vs. band width (right)

2.2.1.3 OLCI-B

Dark Offsets

Dark offsets for OLCI-B show a similar behaviour than for OLCI-A: mean level gaps between different orbits, induced by the presence of a pseudo periodic noise on the east edge of the cameras with a drifting phase.

Evolution of OLCI-B Dark Offset coefficients for band Oa01 and Oa21 are represented in Figure 16.

The periodic noise maps are shown for band Oa21 and smear band respectively in Figure 17 and Figure 18. As it happened for OLCI-A after a few thousands of orbits, the strong periodic noise phase and amplitude drift, present at the very beginning of the mission is now showing a clear stabilization.

Despite this overall stabilization, small evolutions are still noticeable in some bands/camera, like for example pixels at the east edge of camera 1 in band Oa21 since orbit 10000 (upper left map in Figure 17) or in camera 4 band Oa21 since orbit 13000 (lower left map in Figure 17).

Dark Currents

As for OLCI-A there is no significant evolution of the Dark Current coefficients (Figure 19) during the current cycle except the small regular increase (almost linear), for all detectors, since the beginning of the mission (see Figure 20) probably due to an increase of hot pixels (see Figure 21).

2.2.2 Instrument response and degradation modelling [OLCI-L1B-CV-250]

2.2.2.1 Instrument response monitoring

2.2.2.1.1 OLCI-A

Figure 22 shows the gain coefficients of every pixel for two OLCI-A channels, Oa1 (400 nm) and Oa21 (1020 nm), highlighting the significant evolution of the instrument response since early mission.

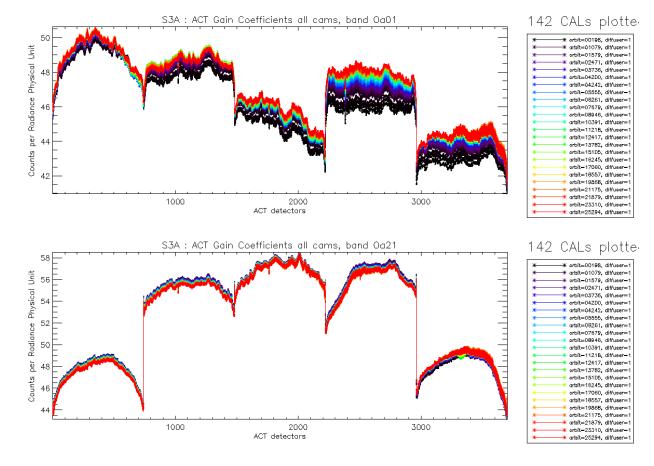

Figure 22: OLCI-A Gain Coefficients for band Oa1 (top) and Oa21 (bottom), all diffuser 1 radiometric calibrations so far except the first one (orbit 183) for which the instrument was not thermally stable yet.

The gains plotted in Figure 22, however are derived using the ground BRDF model which is known to suffer from illumination geometry dependent residual errors (see previous Cyclic Reports for more details). Consequently they are post-processed to replace the ground BRDF model by the in-flight version, based on Yaw Manoeuvres data, prior to determine the radiometric evolution.

Figure 23 displays a summary of the time evolution derived from post-processed gains: the cross-track average of the BRDF corrected gains (taking into account the diffuser ageing) is plotted as a function of time, for each module, relative to a given reference calibration (the 25/04/2016, change of OLCI channel

S3 OLCI Cyclic Performance Report

S3A Cycle No. 066 – S3B Cycle No. 047

Page: 21

2.2.2.1.2 OLCI-B

Figure 24 shows the gain coefficients of every pixel for two OLCI-B channels, Oa1 (400 nm) and Oa21 (1020 nm), highlighting the significant evolution of the instrument response since early mission.

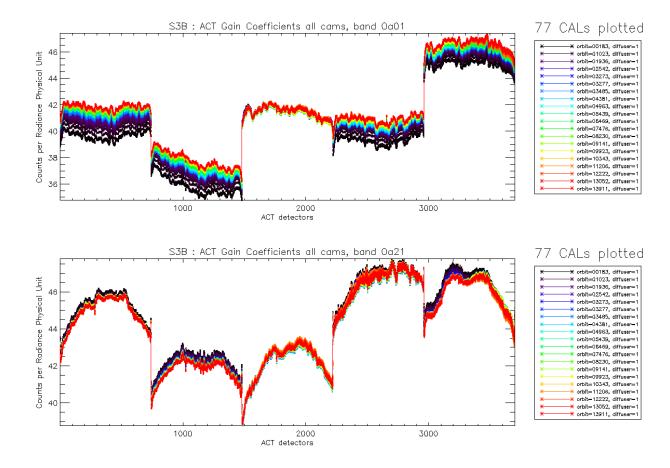

Figure 24: OLCI-B Gain Coefficients for band Oa1 (top) and Oa21 (bottom), all diffuser 1 radiometric calibrations so far except the first one (orbit 167) for which the instrument was not thermally stable yet.

Figure 25 displays a summary of the time evolution derived from post-processed gains: the cross-track average of the BRDF corrected gains is plotted as a function of time, for each module, relative to a given reference calibration (first calibration after channel programming change: 18/06/2018). It shows that, if a significant evolution occurred during the early mission, the trends tend to stabilize. The large amount of points near elapsed time = 220 days is due to the yaw manoeuvre campaign.

The diffuser ageing has been taken into account.

2.2.2.2 Instrument evolution modelling

2.2.2.2.1 OLCI-A

The OLCI-A Radiometric Model has been refreshed and put in operations at PDGS the 15/10/2020 (Processing Baseline 2.71). The model has been derived on the basis of an extended Radiometric

S3 OLCI Cyclic Performance Report

S3A Cycle No. 066 – S3B Cycle No. 047

Ref.: S3MPC.ACR.PR.01-066-047

Issue: 1.0

Date: 15/01/2021

Page: 23

Calibration dataset (from 08/08/2016 to 08/08/2020). It includes the correction of the diffuser ageing for the six bluest bands (Oa1 to Oa6) for which it is clearly measurable. The model performance over the complete dataset (including the 9 calibrations in extrapolation over about 5 months) remains better than 0.09% when averaged over the whole field of view (Figure 26). The previous model, trained on a Radiometric Dataset limited to 28/08/2019, shows clearly a drift of the model with respect to most recent data (Figure 27). Comparison of the two figures shows the improvement brought by the updated Model over almost all the mission. Performance shown on Figure 26 adopts, as for OLCI-B, the dual model approach, i.e. two different models are used to cover the whole mission (red dashed line on Figure 26), each model being fitted on a partial dataset (green dashed line on Figure 26) whose coverage is optimised to provide best performance.

2.2.2.2. OLCI-B

Instrument response and degradation modelling for OLCI-B, including the use of the in-flight BRDF model (based on 11th December 2018 Yaw Manoeuvres), has been refreshed and deployed at PDGS on 15th October 2020 (Processing Baseline 1.48). The model has been derived on the basis of an extended Radiometric Calibration dataset (from 05/11/2018 to 09/08/2020). It includes the correction of the diffuser ageing for the five bluest bands (Oa1 to Oa5) for which it is clearly measurable. The model performance over the complete dataset (including the 9 calibrations in extrapolation over about 5 months) is illustrated in Figure 33. It remains better than 0.07% when averaged over the whole field of view for all band except Oa01 (< 0.095%). The previous model, trained on a Radiometric Dataset limited to 02/10/2019, shows a drift of the model with respect to most recent data, especially for band Oa01 (Figure 34). Comparison of the two figures shows the improvement brought by the updated Model over all the mission.

2.2.3 Ageing of nominal diffuser [OLCI-L1B-CV-240]

2.2.3.1 OLCI-A

There has been no calibration sequence S05 (reference diffuser) for OLCI-A during acquisition cycle 066.

Consequently the results of the last cycle with an ageing sequence (cycle #65) remain valid.

2.2.3.2 OLCI-B

There has been no calibration sequence S05 (reference diffuser) for OLCI-B during acquisition Cycle 047.

Consequently the results of the last cycle with an ageing sequence (cycle #46) remain valid.

2.2.4 Updating of calibration ADF [OLCI-L1B-CV-260]

2.2.4.1.1 OLCI-A

No CAL_AX ADF has been delivered to PDGS during the report period for OLCI-A.

2.2.4.1.2 OLCI-B

No CAL_AX ADF has been delivered to PDGS during the report period for OLCI-B.

2.2.5 Radiometric Calibrations for sun azimuth angle dependency and Yaw Manoeuvres for Solar Diffuser on-orbit re-characterization [OLCI-L1B-CV-270 and OLCI-L1B-CV-280]

2.2.5.1.1 OLCI-A

This activity has not evolved during cycle 066 and results presented in Cycle 15 report are still valid.

2.2.5.1.2 OLCI-B

Activity has started for S3B-OLCI. The SAA domain explored is now increased by the acquisitions from the Yaw Manoeuvres and analysis becomes meaningful. Analysis is on-going.

2.3 Spectral Calibration [OLCI-L1B-CV-400]

2.3.1 OLCI-A

There has been one S02+S03 Spectral Calibration for OLCI-A in the reporting period

- S02 sequence (diffuser 1) on 12/12/2020 11:22 to 11:24 (absolute orbit 25106)
- S03 sequence (Erbium doped diffuser) on 12/12/2020 13:03 to 13:05 (absolute orbit 25107)

and one Spectral calibration S09:

\$ S09 sequence on 12/12/2020 09:04:41 to 09:04:47 (absolute orbit 25105)

The S02/S03 data have been processed and analysed to assess OLCI-A spectral long-term evolution. The absolute results are presented in Figure 40 while its long term evolution is presented Figure 41.

The processing of the S09 calibration sequence (spectral calibration using O_2 absorption and Fraunhofer lines) is illustrated in Figure 42.

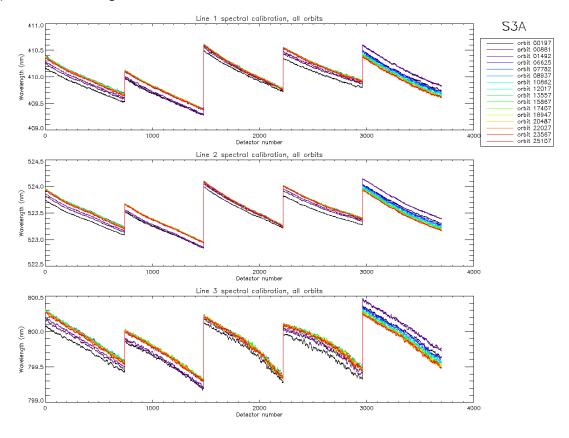

Figure 40: OLCI-A across track spectral calibration from all S02/S03 sequences since the beginning of the mission.

Top plot is spectral line 1, middle plot is spectral line 2 and bottom plot spectral line 3.

Ref.: S3MPC.ACR.PR.01-066-047

Issue: 1.0

Date: 15/01/2021

Page: 40

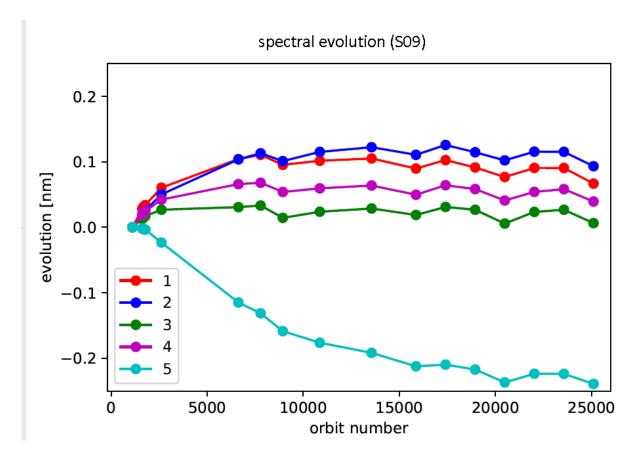

Figure 42: OLCI-A camera averaged spectral calibration evolution as a function of time from S09 calibrations since the 4th may 2016. The last calibration for S09 is from 12 Dec 2020. For each camera, the spectral evolution corresponding derived from spectral lines at 485 nm, 656 nm, 770 nm and 854 nm have been averaged. The data are normalized with the first Spectral Calibration.

We see that the long term evolution of the spectral calibration obtained with sequence S09 (Figure 42) is in rather good agreement with the one obtained with sequence S02/S03 (Figure 41). Indeed, for camera 1, 2, 3 and 4, we observe for the two methods a positive trend of the spectral calibration at the beginning of the mission, which is now rather stabilized, and for camera 5, an obvious negative trend since almost the beginning of the mission which is also stabilizing but more progressively. In all cases, the spectral calibration drift since the beginning of the mission is smaller than ≈0.2 nm and the change with respect to the values included in the Auxiliary Data files is less than 0.1 nm. However, camera 5 still evolves but with a slower rate; only further monitoring will allow to assess the need for an evolution of the Auxiliary Parameters impacted by the instrument spectral model, reflecting the current or future state of the instrument.

Page: 41

2.3.2 OLCI-B

There has been one S02+S03 Spectral Calibration for OLCI-B in the reporting period

- \$ S02 sequence (diffuser 1) on 22/12/2020 11:24 to 11:26 (absolute orbit 13855)
- So3 sequence (Erbium doped diffuser) on 22/12/2020 13:05 to 13:07 (absolute orbit 13856)

and one Spectral calibration S09:

S09 sequence on 22/12/2020 09:06:31 to 09:06:37 (absolute orbit 13854)

The SO2/SO3 data have been processed and analysed to assess OLCI-B spectral long-term evolution. The absolute results are presented in Figure 43 while its long term evolution is presented on Figure 44. The processing of the SO9 calibration sequence (spectral calibration using O2 absorption and Fraunhofer lines) is now available and presented in Figure 45.

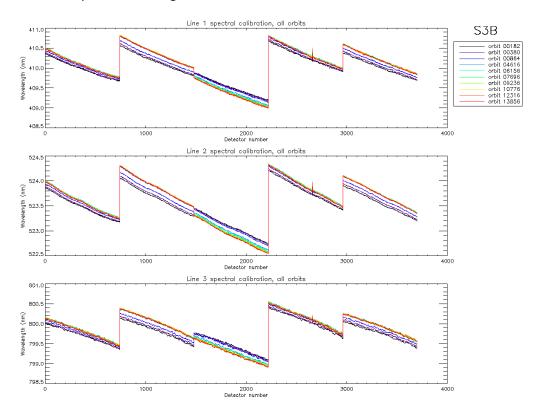

Figure 43: OLCI-B across track spectral calibration from all S02/S03 sequences since the beginning of the mission.

Top plot is spectral line 1, middle plot is spectral line 2 and bottom plot spectral line 3.

Page: 43

Spectral evolution (S09)

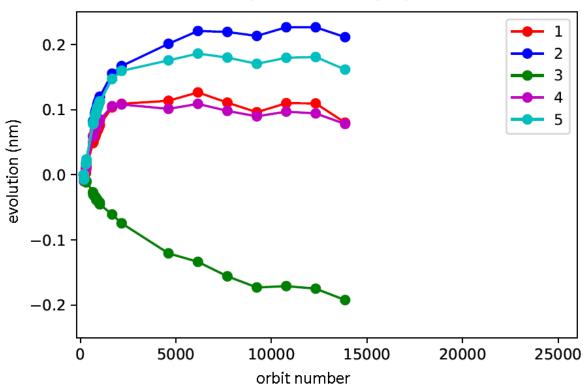

Figure 45: OLCI-B camera averaged spectral calibration evolution as a function of time since launch from S09 calibrations since the beginning of the mission. The last calibration for S09 is from 22 Dec 2020. For each camera, the spectral evolution corresponding derived from spectral lines at 485 nm, 656 nm, 770 nm and 854 nm have been averaged. The data are normalized with the first Spectral Calibration.

Figure 43 to Figure 45 show that:

- As for OLCI-A camera 5, the wavelength calibration drift of OLCI-B camera 3 goes in the opposite direction than for the other cameras.
- It seems than the quick drift of the early mission has stabilized especially for camera 1, 2, 4 and 5.
 The stabilization for camera 3 needs more data (next cycles) in order to be confirmed.
- The results obtained with the S02/S03 method and the one obtained with the S09 method are rather similar.
- The spectral calibration drift is smaller than ≈0.23 nm for all cases.

2.4 Signal to Noise assessment [OLCI-L1B-CV-620]

2.4.1 SNR from Radiometric calibration data

2.4.1.1 OLCI-A

SNR computed for all calibration data (S01, S04 and S05 sequences) as a function of band number is presented in Figure 46.

SNR computed for all calibration data as a function of orbit number for band Oa01 (the less stable band) is presented in Figure 47.

There is no significant evolution of this parameter during the current cycle and the ESA requirement is fulfilled for all bands.

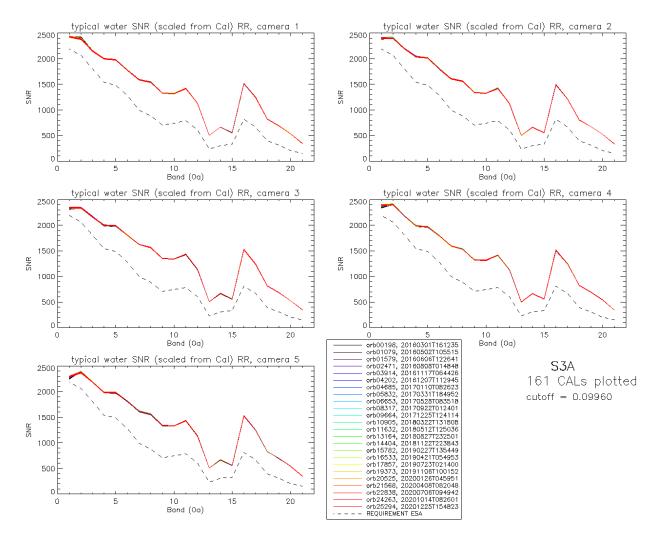

Figure 46: OLCI-A Signal to Noise ratio as a function of the spectral band for the 5 cameras. These results have been computed from radiometric calibration data. All calibrations except first one (orbit 183) are presents with

the colours corresponding to the orbit number (see legend). The SNR is very stable with time: the curves for all orbits are almost superimposed. The dashed curve is the ESA requirement.

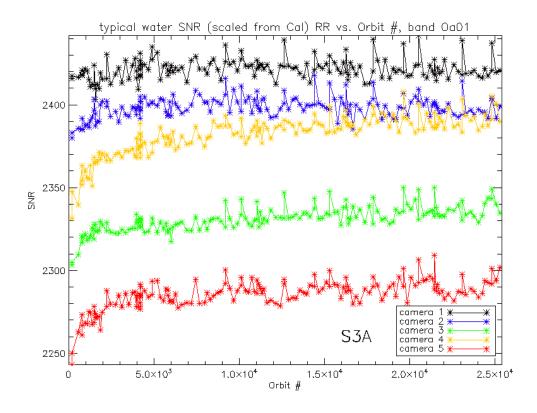

Figure 47: long-term stability of the SNR estimates from Calibration data, example of channel Oa1.

The mission averaged SNR figures are provided in Table 1 below, together with their radiance reference level. According to the OLCI SNR requirements, these figures are valid at these radiance levels and at Reduced Resolution (RR, 1.2 km). They can be scaled to other radiance levels assuming shot noise (CCD sensor noise) is the dominating term, i.e. radiometric noise can be considered Gaussian with its standard deviation varying as the square root of the signal; in other words: $SNR(L) = SNR(L_{ref}) \cdot \sqrt{\frac{L}{L_{ref}}}$. Following the same assumption, values at Full Resolution (300m) can be derived from RR ones as 4 times smaller.

2.4.2 SNR from EO data

2.4.2.1 OLCI-A

There has been no update on SNR assessment from EO data during the cycle. Last figures (cycle 9) are considered valid.

2.4.2.2 OLCI-B

The SNR assessment from EO data has not been applied to OLCI-B considering a) that SNR estimates from RC data have been proved more reliable for OLCI-A and b) that it requires a significant amount of human and machine resources that can be more efficiently used for other tasks.

2.5 Geometric Calibration/Validation

2.5.1 OLCI-A

OLCI-A georeferencing performance is compliant since the introduction of MPC Geometric Calibration, put in production on the 14th of March 2018. It has however significantly improved after its last full revision of GCMs (Geometric Calibration Models, or platform to instrument alignment quaternions) and IPPVMs (Instrument Pixels Pointing Vectors) both derived using the GeoCal Tool and put in production on 30/07/2019.

The following figures (Figure 50 to Figure 55) show time series of the overall RMS performance (requirement criterion) and of the across-track and along-track biases for each camera. New plots (Figure 56 and Figure 57) introduce monitoring of the performance homogeneity within the field of view: georeferencing errors in each direction at camera transitions (difference between last pixel of camera N and first pixel of camera N+1) and within a given camera (maximum bias minus minimum inside each camera). The performance improvement since the 30/07/2019 is significant on most figures: the global RMS value decreases form around 0.35 to about 0.2 (Figure 50), the across-track biases decrease significantly for all cameras (Figure 51 to Figure 55), the along-track bias reduces for at least camera 3 (Figure 53) and the field of view homogeneity improves drastically (Figure 56 and Figure 57, but also reduction of the dispersion – distance between the ± 1 sigma lines – in Figure 51 to Figure 55).

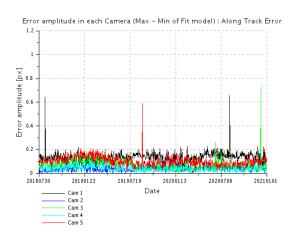

Figure 57: OLCI-A spatial along-track misregistration at each camera transition (left) and maximum amplitude of the along-track error within each camera (left).

2.5.2 OLCI-B

Georeferencing performance of OLCI-B improved significantly with the fourth geometric calibration introduced the 30/07/2019. However, the instrument pointing is still evolving, in particular for camera 2 (Figure 64) and a new geometric calibration has been done and introduced in the processing chain on the 16th of April 2020. Its impact is significant on the along-track biases of all cameras (Figure 59 to Figure 63), but also on the continuity at camera interfaces (Figure 64, left) and on intra-camera homogeneity (Figure 64, right). Since then, further adjustments to the geometric calibration have been introduced, mainly to correct the along-track drifts. The most recent was put in production on 10/12/2020 and its effect can be seen e.g. on left graphs of Figure 59 and Figure 60 (along-track biases of cameras 1 & 2).

3 OLCI Level 1 Product validation

3.1 [OLCI-L1B-CV-300], [OLCI-L1B-CV-310] - Radiometric Validation

3.1.1 S3ETRAC Service

Activities done

The S3ETRAC service extracts OLCI L1 RR and SLSTR L1 RBT data and computes associated statistics over 49 sites corresponding to different surface types (desert, snow, ocean maximizing Rayleigh signal, ocean maximizing sunglint scattering and deep convective clouds). The S3ETRAC products are used for the assessment and monitoring of the L1 radiometry (optical channels) by the ESLs.

All details about the S3ETRAC/OLCI and S3ETRAC/SLSTR statistics are provided on the S3ETRAC website http://s3etrac.acri.fr/index.php?action=generalstatistics

- Number of OLCI products processed by the S3ETRAC service
- Statistics per type of target (DESERT, SNOW, RAYLEIGH, SUNGLINT and DCC)
- Statistics per sites
- Statistics on the number of records

For illustration, we provide below statistics on the number of S3ETRAC/OLCI records generated per type of targets (DESERT, SNOW, RAYLEIGH, SUNGLINT and DCC) for both OLCI-A (Figure 66) and OLCI-B (Figure 67).

3.1.2 Radiometric validation with DIMITRI

Highlights

OLCI-A and OLCI-B L1B radiometry verification as follow:

- The verification is performed over Ocean-sites until 15th of December 2020 and over Desert-sites until 31st of December 2020.
- All results from OLCI-A and OLCI-B over Rayleigh, Glint and PICS are consistent with the previous cycle over the used CalVal sites.
- Good stability of both sensors OLCI-A and OLCI-B could be observed, nevertheless the timeseries average shows higher reflectance from OLCI-A.
- Bands with high gaseous absorption are excluded.

Verification and Validation over PICS

- The ingestion of all the available L1B-LN1-NT products from OLCI-A and OLCI-B over the 6 desert calval-sites (Algeria3 & 5, Libya 1 & 4 and Mauritania 1 & 2) has been performed until the 31st of December 2020.
- 2. The results are consistent overall the six used PICS sites (Figure 68 and Figure 69). Both sensors show a good stability over the analysed period.
- 3. The temporal average over the period **January 2020 Present** of the elementary ratios (observed reflectance to the simulated one) for **OLCI-A** shows gain values between 2-4% over all the VNIR bands (Figure 70). Unlikely, the temporal average over the same period of the elementary ratios for **OLCI-B** shows gain values within 2% (mission requirements) over the VNIR spectral range (Figure 70). The spectral bands with significant absorption from water vapor and O₂ (Oa11, Oa13, Oa14, Oa15 and Oa20) are excluded.

Page: 63

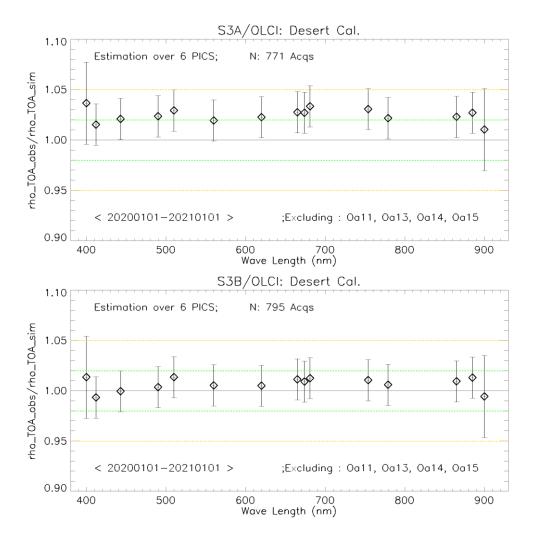

Figure 70: The estimated gain values for OLCI-A and OLCI-B over the 6 PICS sites identified by CEOS over the period January 2020-Present as a function of wavelength. Dashed-green and orange lines indicate the 2% and 5% respectively. Error bars indicate the desert methodology uncertainty.

Cross-mission Intercomparison over PICS:

X-mission Intercomparison with MODIS-A and MSI-A has been performed until February 2019 and June 2020 respectively. Figure 71 shows time-series of the elementary ratios from S2A/MSI, Aqua/MODIS, S3A/OLCI and S3B/OLCI over the LYBIA4 site for the period April 2016 until February 2019 and June 2020, respectively.

We observe a clear stability over the three sensors, associated with higher reflectance from OLCI-A wrt to MSI-A and MODISA. MODISA shows higher fluctuation wrt to MSI-A and OLCI-A/B ones.

Figure 72 shows the time averages of estimated gains for the same sensors (MSI-A, OLCI-A, OLCI-B and MODIS-A) over PICS. The spectral bands with significant absorption from water vapour and O2 are excluded. OLCI-A seems to have higher gain wrt the other sensors, which means that OLCI-A has brighter reflectance than its simulated one by PICS method.

Validation over Rayleigh

Rayleigh method has been performed from the available mini-files over the **last 12 months** for OLCI-A and OLCI-B. The results were produced with the configuration (ROI-AVERAGE). The gain coefficients of OLCI-A are consistent with the previous results. Bands Oa01-Oa05 display biases values between 5%-7% while bands Oa06-Oa09 exhibit biases between 2%-3% higher than the 2% mission requirements (Figure 73). The gain coefficients of OLCI-B are lower than OLCI-A ones, where bands Oa01-Oa05 display biases values about 3-5%, when bands Oa6-Oa9 exhibit biases better than 2% mission requirements (Figure 73).

Validation over Glint and synthesis

Glint calibration method with the configuration (ROI-PIXEL) has been performed over the **last 12 months** for OLCI-A and OLCI-B. The outcome of this analysis shows a good consistency with the desert and Rayleigh outputs over the NIR spectral range Oa06-Oa09 for both sensors. Glint results from OLCI-A show that the NIR bands are within the 2% (mission requirements), except Oa21 which shows higher biases more than ~5% for both sensors (see Figure 73). Again, the glint gain from OLCI-B looks slightly lower than OLCI-A one.

3.1.3 Radiometric validation with OSCAR

The OSCAR Rayleigh have been applied to the S3A and S3B S3ETRAC data from the 6 oceanic calibration sites listed in Table 3 using a new chlorophyll climatology, which has been derived from the CMEMS OLCI monthly CHL products considering the years 2017, 2018 and 2019.

Table 3. S3ETRAC Ocean Calibration sites

Site Name	Ocean	North Latitude	South Latitude	East Longitude	West Longitude
PacSE	South-East of Pacific	-20.7	-44.9	-89	-130.2
PacNW	North-West of Pacific	22.7	10	165.6	139.5
PacN	North of Pacific	23.5	15	200.6	179.4
AtlN	North of Atlantic	27	17	-44.2	-62.5
AtIS	South of Atlantic	-9.9	-19.9	-11	-32.3
IndS	South of Indian	-21.2	-29.9	100.1	89.5

In Figure 74 the average OSCAR OLCI-A and OLCI-B Rayleigh results are given for December 2020. The results are obtained with the new climatology. In Figure 75 and Table 4 the average of all scenes currently (re)processed with this new climatology is given. This average is obtained from respectively 582 OLCI-B and 399 OLCI-A scenes with valid results. Reprocessed scenes include all months of 2019 and May to December 2020.

4.1.2 Comparisons with MERIS MGVI and MTCI climatology

This report presents the comparison between MERIS and OLCI land products between 8th December 2020 and 11th January 2021. The comparison is conducted using 3x3 pixel extractions over 42 established validation sites. The sites are distributed across a range of latitudes and include representative land cover types (Table 6). Statistical measures of the comparison between MERIS and OLCI products are presented in Table 2. In general, there is good agreement between the land products with strong R2 values and biases around 0. For BE-Brasschaat and FR-EstreesMons the OTCI extractions are higher than recorded in the MTCI archive. There are similar seasonal trajectories and timings shown in the extractions from both products at the following sites reviewed in this monthly report: BE-Brasschaat, DE-Haininch and FR-Estrees-Mons. The monthly mean extractions from all sites are shown in Figure 99. OTCI from S3B shows a strong agreement with the MERIS archive, $R^2 = 0.93$, NRMSD < 0.08 with very low bias, -0.01. OGVI similarly shows a strong agreement with the MERIS archive, $R^2 = 0.93$, NRMSD < 0.15 with a slightly higher bias of 0.06. The performance results are available in the MPC web app (https://s3mpcsoton.shinyapps.io/s3mpc gui/).

5 Level 2 Water products validation

5.1 [OLCI-L2-CV-210, OLCI-L2-CV-220] – Vicarious calibration of the NIR and VIS bands

Results are not further discussed here as SVC is now implemented directly by EUMETSAT.

5.2 [OLCI-L2WLR-CV-300, OLCI-L2WLR-CV-310, OLCI-L2WLR-CV-32, OLCI-L2WLR-CV-330, OLCI-L2WLR-CV-340, OLCI-L2WLR-CV-350, OLCI-L2WLR-CV-360 and OLCI-L2WLR-CV-370] — Level 2 Water-leaving Reflectance product validation.

5.2.1 Acknowledgements

S3-MPC acknowledges all PIs mentioned below and their respective institutions for their valuable contribution to the validation of OLCI L2 water products with a special emphasis on AERONET-OC PIs for their unique contribution to NRT data validation and a special mention to Giuseppe Zibordi maintaining and providing data over 5 ground stations. AERONET-OC is indeed from far the largest contributor of Fiducial Reference Measurements for routine quantitative data validation.

5.2.2 OLCI-A

Activities done

- The focus for this time period has been on the rolling archive Non Time Critical (NT) data until the 11th of January 2021.
- Current reporting period is hereafter compared to the reprocessed archive covering the April 2016 to November 2017 period. No issues are reported neither in the extraction process nor in OLCI data.
- All extractions and statistics have been regenerated on the current rolling archive availability including all the extraction since July 2017. The available matchups therefore represent over almost three years of operation.
- At best 481 and 487 matchups at 490 and 560nm respectively are useful for this time period. OLCI's performances remain nominal.

Overall Water-leaving Reflectance performance

Scatter plots and Performance Statistics

Figure 100 to Figure 102 below present the scatterplots and statistics of OLCI FR versus in situ reflectance. Two time periods are considered:

- The reprocessed archive covering the April 2016 to November 2017 time period
- The current reporting period computed on the NT dataset.

The current reporting period statistics are in line with the reprocessed dataset.

Table 7 below summarises the statistics over the reprocessing period while Table 8 provides the same figures for the NT rolling Archive over July 2017 – present. The latter statistics are almost within the requirements (5% accuracy in the blue/green bands) – as demonstrated by the RPD values between 2 and 4.8%, with the noticeable exception of 400 and 412 nm with 9-10%. Performances over the current period appear a bit lower than for the calibration period (except at 412 nm), but of the same order of magnitude.

5.2.3 OLCI-B

Activities done

- The focus for this time period has been on the rolling archive Non Time Critical (NT) data until the 11th of January 2021.
- All extractions and statistics have been regenerated on the current rolling archive availability including all the extraction since February 2019.
- At best 310 and 336 matchups at 490 and 560nm respectively are useful for this time period.

It must be noted that OLCI-B has no SVC adjustment and as such cannot be expected to provide performances of the same level of quality than OLCI-A.

Overall Water-leaving Reflectance performance

Scatter plots and Performance Statistics

- Figure 105 below presents the scatterplots and statistics of OLCI-B FR versus in situ reflectance.
- ❖ Table 9 below summarises the statistics over the current reporting period.

5.3 [OLCI-L2WLR-CV-430] – Algorithm performance over spatial and temporal domains

There has been no new result during the cycle. Last figures (cycle 27) are considered valid.

5.4 [OLCI-L2WLR-CV-510 & 520] – Cloud Masking & Surface Classification for Water Products

There has been no new result during the cycle. Last figures (cycle 065/046) are considered valid.

5.5 [OLCI-L2WLR-CV530] Validation of Aerosol Product

There has been no new result during the cycle. Last figures (cycle 065/046) are considered valid.

5.6 [OLCI-L2WLR-CV-380] Development of calibration, product and science algorithms

There has been no new development on calibration, product and science algorithms during the cycle.

8 Events

For OLCI-A, two Radiometric Calibration Sequences have been acquired during Cycle 066:

- S01 sequence (diffuser 1) on 10/12/2020 13:34 to 13:35 (absolute orbit 25077)
- \$ S01 sequence (diffuser 1) on 25/12/2020 15:48 to 15:50 (absolute orbit 25294)

For OLCI-B, one Radiometric Calibration Sequence has been acquired during Cycle 047:

S01 sequence (diffuser 1) on 26/12/2020 09:39 to 09:41 (absolute orbit 13911)

There has been one S02+S03 Spectral Calibration for OLCI-A in the reporting period

- S02 sequence (diffuser 1) on 12/12/2020 11:22 to 11:24 (absolute orbit 25106)
- So3 sequence (Erbium doped diffuser) on 12/12/2020 13:03 to 13:05 (absolute orbit 25107)

and one Spectral calibration S09:

\$ S09 sequence on 12/12/2020 09:04:41 to 09:04:47 (absolute orbit 25105)

There has been one S02+S03 Spectral Calibration for OLCI-B in the reporting period

- So2 sequence (diffuser 1) on 22/12/2020 11:24 to 11:26 (absolute orbit 13855)
- So3 sequence (Erbium doped diffuser) on 22/12/2020 13:05 to 13:07 (absolute orbit 13856)

and one Spectral calibration S09:

S09 sequence on 22/12/2020 09:06:31 to 09:06:37 (absolute orbit 13854)
