1 Introduction

The purpose of this document is to report on the performance and data quality of the Copernicus Sentinel-3 Surface Topography Mission (STM) LAND products. The constellation currently includes Sentinel-3A and Sentinel-3B altimetry satellites. This document is associated with data dissemination on a cyclic basis and is generated a few days after the end of Sentinel-3B cycle.

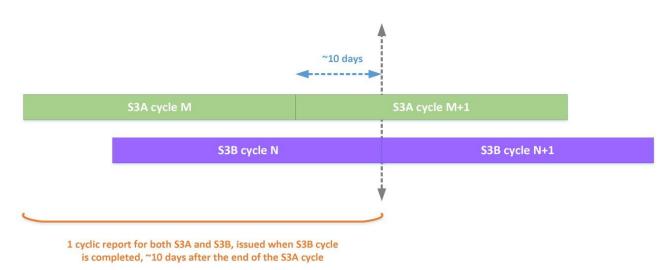

Figure 1.1 S3A and S3B cycles chronology

The SRAL Level 2 products assessed hereafter are produced by the ESA Sentinel-3 LAND Processing Centre. One of the main goals of the cyclic report is to detect and report as quickly as possible any events, or anomaly, impacting the data quality. Subsequently, the assessments are made on the Short Time Critical (STC) products, generally delivered 48 hours after data acquisitions. Differences are expected with the Non Time Critical (NTC) products, for which the orbit data and several geophysical corrections are consolidated.

The main objectives of this document are:

- > To provide a data quality assessment of the Sentinel-3 SRAL Level 2 STC LAND products
- ➤ To report on any changes likely to impact data quality at any level, from instrument status to software configuration.
- To present the major useful results for S3A cycle 089, from 17/08/2022 to 13/09/2022.
- To present the major useful results for S3B cycle 070, from 27/08/2022 to 23/09/2022.

2 Cycle overview

During these cycles, Sentinel-3A and Sentinel-3B SRAL operated in SAR mode over the ice sheets. For Level-2 STC Land ice products over the polar ice sheets the OCOG (Ice-1) retracker provides the largest amount of ice sheet elevation data, and most failures are located close to the ice sheet margins.

Parameter:	Comments:
Orbit	All orbits and passes are avaliable. The change of processing center has resulted in file duplicates or splitting of tracks. See Section 4.1.
Availability of geophysical corrections	For both S3A and S3B are a few ocean tides are missing over the Antarctic Ice Shelves. See Table 4.2 - 4.4
Availability of auxiliary data	Nominal auxiliary data availability
Geophysical parameters	Nominal performances in the altimeter-derived geophysical parameters. The missing geophysical correction is resulting in a missing observation in the elevation parameters
Specific investigations	N/A
Orbit cross-over statistics	The UCL ice sheet retracker enables fewer cross-overs to be evaluated than for the OCOG/ICE-1 retracker. The ratio between the number of cross-overs for the two retracker is normal. For cross-overs less than 1 meter shows a median bias less than a centimetre for S3A and S3B and a standard deviation < 35 cm.
Status	Overall nominal data availability and nominal mission performances on this cycle

Table 2.1 General overview of the data availability and mission performances for the S3A and S3B cycles evaluated Colours indicate performance: OK (green), Warning (yellow), and Not ok (red)

3 Processing baseline

Table 3.1 details the versions of the Processing Baseline (PB), and Level-1 and Level-2 Instrument Processing Facility software used for the products assessed. This is part of the Baseline Collection (BC) 004.

Cycle		Processing Baseline	IPF SM2 version	IPF SR1 version	IPF MW1 version
Sentinel-3A			06.10	06.30	06 11
Sentinel-3B	070	1.49	06.19	06.20	06.11

Table 3.1 Processing baseline and IPF details.

The evolutions of the Sentinel-3 STM Processing Baseline since July 2016, end of commissioning phase, are summarized in the "Sentinel Online" Web pages:

https://sentinels.copernicus.eu/web/sentinel/technical-guides/sentinel-3-altimetry/processingbaseline

4 Data availability and missing measurements

4.1 Orbit coverage and missing measurements

There may occur delays in the processing of the data at the processing centre, which means that the data products assessed in the cyclic reports might not represent 100% of the orbits in the full cycle. The percentage of L2 products of the full cycle, which this report builds on is presented in the Table 4.1.

For S3A, 772 files are received out of the 770 expected, this is due to multiple files for orbit 315 and 321. For S3B, 774 files are received out of the 770 expected, this is due to multiple files for orbit 6, 22, 120, 235 and 278. Hence, all orbits/pass are accounted for over the ice sheets

Cycle		Product type	Latency	Passes	Expected passes	% passes received
Sentinel-3A	089	SR 2 LAN	STC	770	770	100%
Sentinel-3B	070	SK_Z_LAN	310	770	770	100%

Table 4.1 Data availability and the percentage of full cycle of STC products

4.2 Modes of operations

The on-board tracker of the Sentinel-3 altimeter has three different possible modes:

- Closed-loop mode: autonomous positioning of the range window using the median algorithm
- Open-loop mode: range window position based on a priori knowledge of terrain altitude derived from a Digital Elevation Model (DEM).
- Open-loop with fixed gain mode in addition to open-loop, constant acquisition gain values are applied

Figure 4.1 shows the tracking modes for both S3A and S3B. Mainly, the acquisition of the satellites is in closed-loop, except for Elephant Island and Coronation Island in the Southern Ocean where the tracking modes are Open-loop. In addition, open-loop commands have been defined for S3A over several specific continental glaciers (for glaciers in Himalaya, Patagonia, Alpes, Pyrénées, Andes and Tadjikistan).

Figure 4.1 Tracking mode for S3A and S3B over Greenland from the mode_id_20_ku parameter

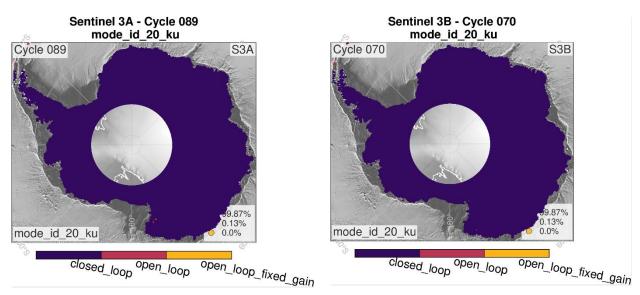

Figure 4.2 Tracking mode for S3A and S3B over Antarctica from the mode_id_20_ku parameter

Since December 9th, 2021, the S3A also tracks with open-loop over targets in Victoria Land, Antarctica. The Figure 4.3 displays a satellite view over Victoria Land area, with the S3A tracks for which new Open Loop Tracking Commands have been defined. The theoretical ground tracks are referenced by Relative Orbit Number (RON).

More information about these acquisitions can be found in Sentinel Online:

https://sentinels.copernicus.eu/web/sentinel/-/sentinel-3a-changes-acquisition-mode-over-victoria-land-glaciers/1.2?redirect=%2Fweb%2Fsentinel%2Fnews

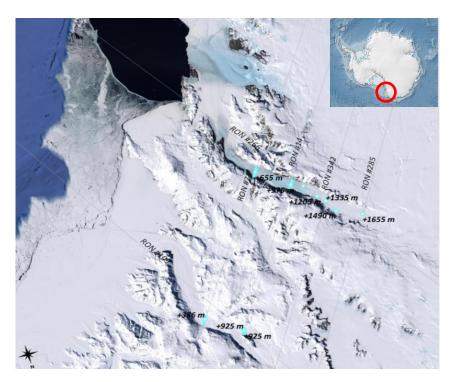

Figure 4.3 Satellite view of the Antarctica glacier area covered by new targets for Sentinel-3A in Open-Loop mode. Targeted glaciers used to set new elevation commands for Sentinel-3A SRAL altimeter waveform reception window in Open-Loop Mode is shown (cyan boxes) with corresponding elevation values. Copyright: Google Satellite, figure design CNES.

4.3 Availability of geophysical corrections

The range from the satellite to the surface for each measurement is computed by applying several geophysical corrections and internal delay to the initial uncorrected range. It is important to track the availability and validity of these corrections since they are required for the final L2 elevation parameters and the derived ice sheet surface elevation change. The data over ice sheets and ice shelves are selected by using the *surface_class* flag (Section 5.2.2) over Greenland and Antarctica.

In this section the availability of geophysical corrections in the L2 products over ice sheets and ice shelves are analysed and presented.

4.3.1 Availability of Geophysical Corrections over Ice Sheets

The geophysical corrections usually relevant for range measurements over ice sheets are the dry and wet troposphere, ionosphere delays, solid Earth tide, ocean loading tide, and polar tide. Table 4.2 and Table 4.3 summarize the availability for the Greenland and Antarctica Ice Sheets, for S3A and S3B.

5 Geophysical parameters monitoring

5.1 Geophysical parameters derived from altimetry

Over land ice two different retrackers are implemented in the Sentinel-3 Instrument Processing Facilities (IPF) to retrieve geophysical parameters from SAR mode waveforms:

- The "OCOG/ICE-1 retracker" (Wingham D J, Rapley C G, and Griffiths H 1986; Bamber 1994) is an empirical algorithm commonly used over land surfaces. The OCOG/ICE-1 retracker is robust and will almost always return a topography estimation, even over rugged or steep topography, where the altimetry waveform may exhibit complex waveform shapes.
- The "UCL ice sheet retracker" is a model fit retracker, optimised for use over areas of low slope where the returned waveform has a classical shape typical of flat and smooth ice sheet surfaces. The echo model used has a modified gaussian form, corresponding to a six parameterizable function with 5-section modelling. It has a heritage from the CryoSat-2 mission's Wingham/Wallis retracker (Wingham and Wallis 2010).

Two main geophysical parameters are derived from both retrackers:

- The surface elevation with respect to the reference ellipsoid (WGS-84). Parameter's name in the level-2 LAND products are "elevation_ocog_20_ku" and "elevation_ice_sheet_20_ku", respectively estimated with the "OCOG/ICE-1" and "UCL ice sheet" retrackers.
- The backscattering coefficient (Sigma-0). Parameter's name in the level-2 LAND products are "sigO_ocog_20_ku" and "sigO_ice_sheet_20_ku", respectively estimated with the "OCOG/ICE-1" and "UCL ice sheet" retrackers. The backscatter values are controlled by surface characteristics, such as slope, roughness, and surface properties (volume vs. surface scattering). It is an important parameter and is used for deriving accurate estimates of ice/snow surface elevation changes.

In addition, the altimeter range and backscattering coefficient derived from the Pseudo-LRM (PLRM) waveforms are also available in the level-2 products assessed. They are retrieved by the ICE-2 retracker (Legresy and Remy 1997). Parameter's names are respectively "range_ice_20_plrm_ku" and "sig0_ice_20_plrm_ku".

5.1.1 20 Hz Ku Band Elevation (elevation_ice_sheet_20_ku)

Figure 5.1 shows the elevation_ice_sheet_20_ku parameter over the Greenland ice sheet for the S3A and S3B full cycles, while Figure 5.2 shows the percentage of parameter failure (NaN reported) evaluated in 5x5 km grid cells.

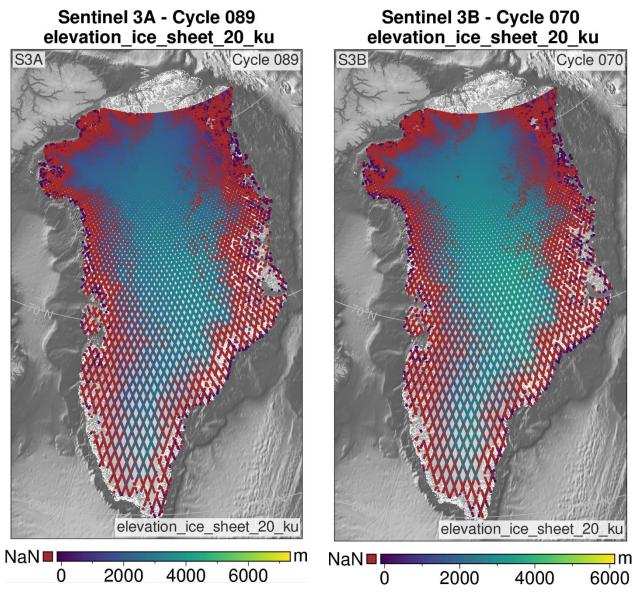

Figure 5.1 SAR mode Ice sheet elevation over Greenland from the elevation_ice_sheet_20_ku parameter

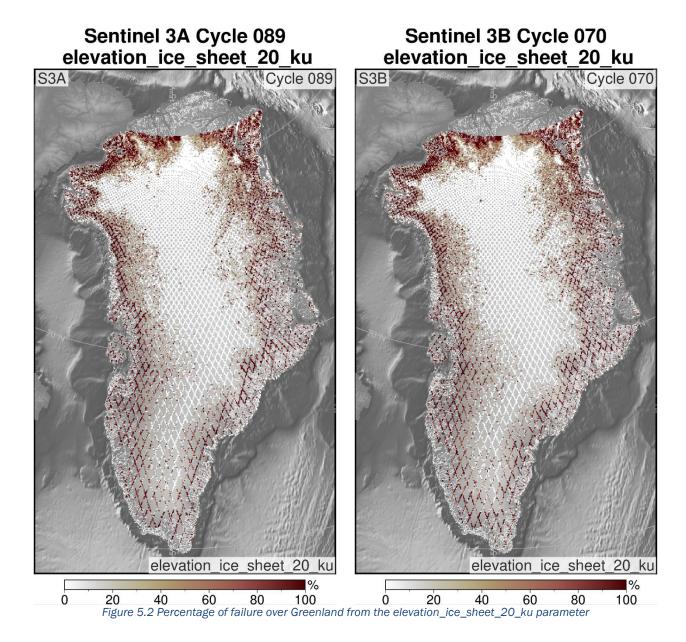

Figure 5.3 shows the elevation_ice_sheet_20_ku parameter over Antarctica for the S3A and S3B full cycles, while Figure 5.4 shows the percentage of parameter failure (NaN reported) evaluated in 10x10 km grid cells.

5.1.6 20 Hz Ku Band OCOG (Ice-1) Range (range_ocog_20_ku)

Figure 5.25 shows the range_ocog_20_ku parameter over the Greenland ice sheet for the S3A and S3B full cycles, while Figure 5.26 shows the percentage of parameter failure (NaN reported) evaluated in 5x5 km grid cells. Figure 5.27 shows the range_ocog_20_ku parameter over the Antarctic ice sheets for the S3A and S3B full cycles, while Figure 5.28 shows the percentage of parameter failure (NaN reported) evaluated in 10x10 km grid cells.

5.1.7 PLRM Ice Range (range_ice_20_plrm_ku)

The PLRM range over the Greenland ice sheet and the Antarctic ice sheets are shown in Figure 5.29 and Figure 5.31, respectively. Their respective percentage of parameter failure (NaN reported) is shown in Figure 5.30 and Figure 5.32. The latter is evaluated in 5x5 km grid cells in Greenland and in 10x10 km grid cells in Antarctica.

5.1.8 PLRM Ice Sigma0 (sig0_ice_20_plrm_ku)

The backscatter coefficient (sigma0) derived from the 20 Hz Ku-PLRM waveform (sig0_ice_20_plrm_ku) parameter are shown below. The PLRM Sigma0 over the Greenland and the Antarctica ice sheets are shown in Figure 5.33 and Figure 5.36, respectively. Their respective percentage of parameter failure (NaN reported) are shown in Figure 5.35 and Figure 5.38. The latter are evaluated in 5x5 km grid cells in Greenland and in 10x10 km grid cells in Antarctica.

5.1.9 Waveform Quality Flag (waveform_qual_ice_20_ku)

The waveform quality flag gives the data users information about the quality of the waveforms for use in the calculation of range and elevation, and hence on the useability of the data. The criteria applied to assess each waveform are listed below Table 2.1. The value of waveform_qual_ice_20_ku is zero (ok) if all tests are passed. The waveform quality flags for the present S3A and S3B cycles are shown for the Greenland ice sheet in Figure 5.39, and for Antarctica in Figure 5.40.

Test Description	Threshold	Flag Bit Set
Total Power in waveform < threshold	2500	1
Average noise power in gates $6-9^* > $ threshold *Noise gates starts at 0	12.5	2
Variance > threshold	7.0	4
Leading Edge Test > threshold Flag set if power to left of gate 42 > threshold * power to right	1.0	8
Peakiness < Low Threshold	0.9	16
Peakiness > High Threshold	1e12	32

Table 5.1 The thresholds used for each waveform quality test

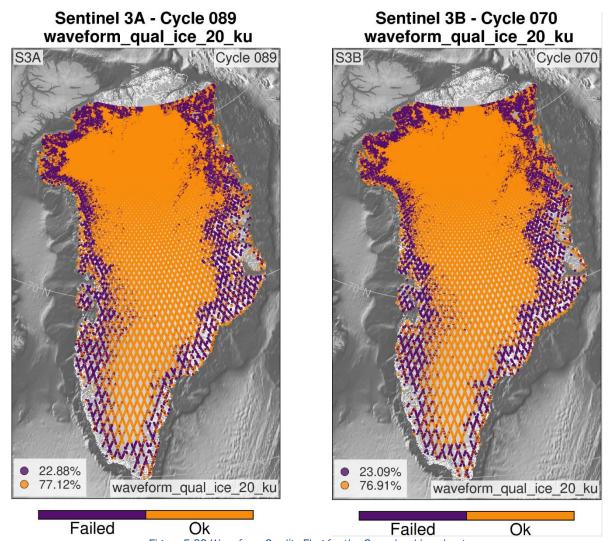

Figure 5.39 Waveform Quality Flag for the Greenland ice sheet

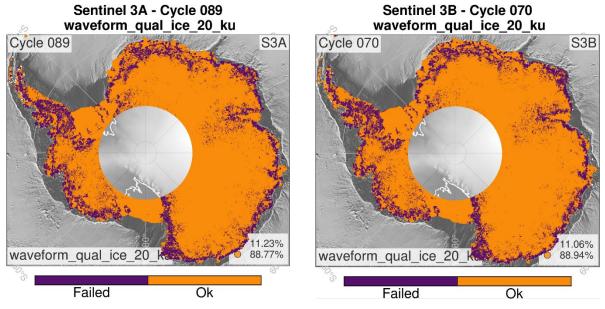

Figure 5.40 Waveform Quality Flag for Antarctica

5.1.10 Slope correction

A slope correction is applied to each measurement to relocate the SAR echo to the point of closest approach (POCA). The slope-corrected coordinates are given by the variables lat_cor_20_ku and lon_cor_20 ku for the 20 Hz Ku measurements. The figures below show whether the slope correction was successful or not over Greenland (Figure 5.41) and Antarctica (Figure 5.42).

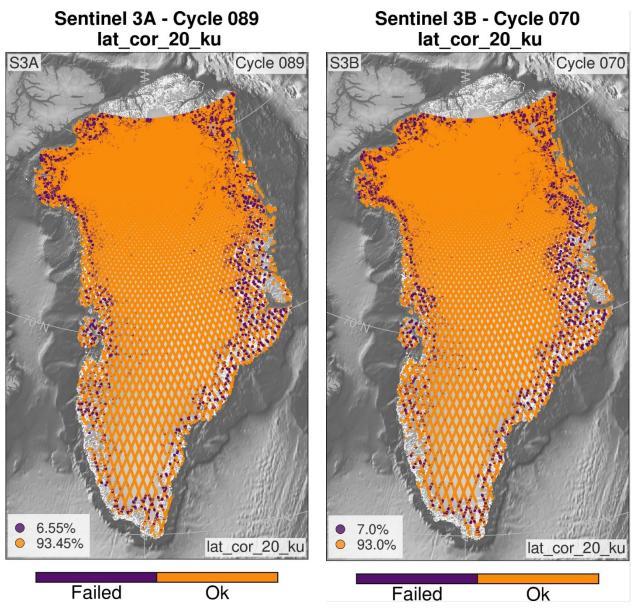

Figure 5.41 Slope correction failure for the Greenland ice sheet

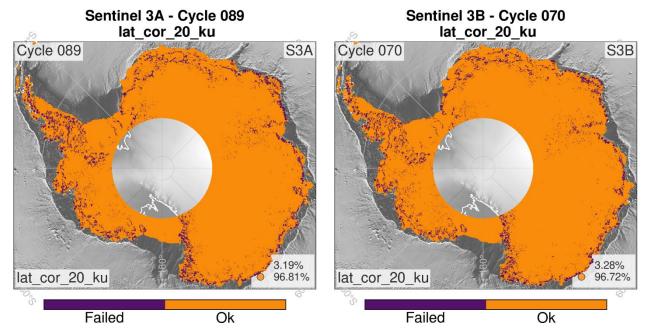

Figure 5.42 Slope correction failure for Antarctica

5.2 Auxiliary parameters monitoring

Besides the information derived from the individual altimetric waveforms, the S3A and S3B products contain several geophysical parameters, which are derived from auxiliary data, and which are useful for the end-user of the data products. These parameters include surface type, surface class, and slope correction. In the following, these geophysical parameters for the current S3A and S3B cycles are presented.

5.2.1 20 Hz Ku Band Surface Type (surf_type_20_ku)

The 20 Hz Ku band surface type parameter (surf_type_20_ku) is derived from a static grid which provides four types: open oceans or semi-enclosed seas, enclosed seas or lakes, continental ice, and land. The surf_class_20_ku parameter for the current cycles of S3A and S3B are shown for Greenland in Figure 5.45 and for Antarctica in Figure 5.46. The figures also provide information on the percentage of data that falls into each surface class.

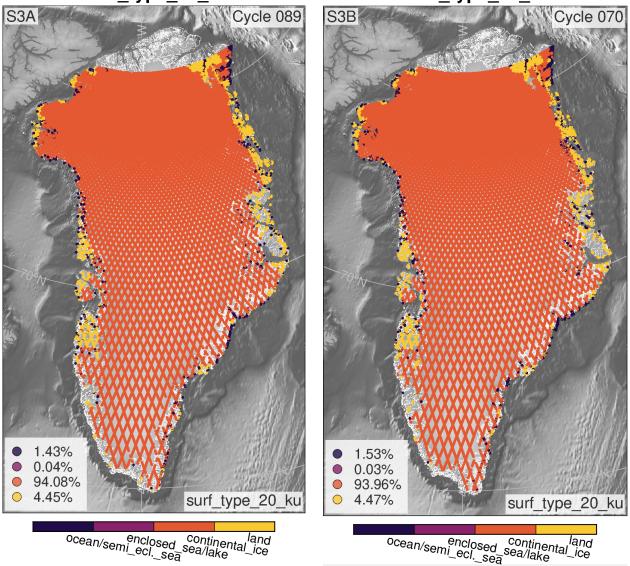

Figure 5.43 Surface Type for Greenland ice sheet from the surf_type_20_ku parameter

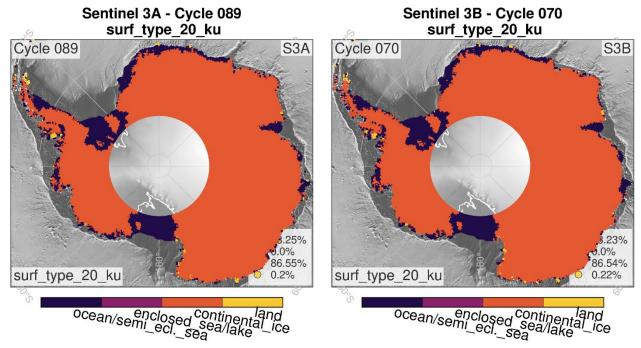

Figure 5.44 Surface Type for Antarctic Ice Sheet and Ice cap from the surf_type_20_ku parameter

5.2.2 20 Hz Ku Band Surface Class (surf_class_20_ku)

The 20 Hz Ku surface classification parameter (surf_class_20_ku) is derived from MODIS and GlobCover data. The possible surface classes are: Open ocean, Land, Continental water, Aquatic vegetation, Continental ice, Floating ice, and Salt basins. The surf_class_20_ku parameter for the current cycles of S3A and S3B are shown for Greenland in Figure 5.45 and for Antarctica in Figure 5.46. The figures also provide information on the percentage of data that falls into each surface class.

6 Crossover Analysis

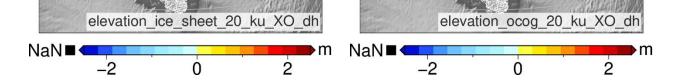

The observed elevation difference at ground-track crosses is a primary method of assessing the precision of L2 altimetry elevation data. Here, we assess the elevation difference for the two available retrackers:

- UCL Ice sheet retracker ("elevation_ice_sheet_20_ku")
- OCOG/ICE-1 retracker ("elevation_ocog_sheet_20_ku")

The crossover difference of the elevation observations is derived for the full cycle of observations. It should be noted that the ice sheet surface elevation is in some area changing over the timespan of a cycle due to e.g., weather and snowpack properties. This may give raise to a natural crossover bias which is not associated with the precision of L2 altimetry elevation data. Therefore, for more in-depth analysis the timing between crossovers should be shortened. The crossover statistics are below as tables, maps, and histograms.
